

Netflix Data Analysis Using POWERBI

Summary:

The **Netflix Data Analysis Using Microsoft Power BI** project focused on analyzing Netflix content and customer viewing behavior to generate meaningful business insights. The project used datasets containing information about Netflix shows, movies, customer ratings, watch time, subscription types, and viewer demographics. Tools such as Microsoft Excel and Power BI were used for data cleaning, transformation, analysis, and dashboard creation.

The project began with data preprocessing activities such as handling missing values in director, cast, and country columns, standardizing date formats, and organizing rating categories. Customers were grouped by age ranges to understand audience distribution, while subscription plans like Basic, Standard, and Premium were analyzed to compare watch time and engagement levels.

Several descriptive and comparative analyses were performed to identify the top 10 most-watched shows and movies, the most popular genres by country, and the distribution of user ratings from 1 to 5 stars. The project also compared newly added versus older content, analyzed ratings between TV Shows and Movies, and identified the highest-rated genres such as Anime and Documentary.

Market and business insights were generated by examining subscription market share, customer viewing behavior, and engagement trends. The analysis showed that Premium subscribers and TV Show viewers demonstrated higher engagement and watch time. The project also explored the influence of directors and cast members on ratings and identified countries with lower engagement levels to suggest content localization strategies.

Interactive dashboards and visualizations created in Power BI transformed raw Netflix data into clear and actionable insights. Overall, the project demonstrated how data analytics and visualization techniques can help Netflix improve customer engagement, optimize content strategies, and support better business decision-making.
